Math 115 Theorems

1. **Corollary.** Let $a = \prod_p p^{\alpha(p)}$, $b = \prod_p p^{\beta(p)}$, $c = \prod_p p^{\gamma(p)}$.
   (a) $ab = c \iff \alpha(p) + \beta(p) = \gamma(p) \ \forall p$.
   (b) $a \mid c \iff \alpha(p) \leq \gamma(p) \ \forall p$.
   (c) c is a common divisor of a and b iff $\gamma(p) \leq \min(\alpha(p), \beta(p)) \ \forall p$.
   (d) $\gcd(a,b) = \prod_p p^{\min(\alpha(p),\beta(p))}$.
   (e) $\operatorname{lcm}(a,b) = \prod_p p^{\max(\alpha(p),\beta(p))}$.
   (f) c is the square of an integer iff $\gamma(p)$ is even for all p.
2. **Pascal's Identity.** $\binom{\alpha+1}{k+1} = \binom{\alpha}{k+1} + \binom{\alpha}{k}$.
3. **Binomial Theorem.** $(x+y)^n = \sum_{i=0}^n \binom{n}{i} x^{n-i} y^i$.
4. **Theorem.** If $a \equiv b \pmod{m}$, then $\gcd(a,m) = \gcd(b,m)$.
5. **Euler's Theorem.** If $\gcd(a,m) = 1$, then $a^{\phi(m)} \equiv 1 \pmod{m}$.
6. **Fermat's Little Theorem.** Let p be a prime. Then:
   (a) $\forall a \in \mathbb{Z}$ and a not a multiple of p, then $a^{p-1} \equiv 1 \pmod{p}$.
   (b) $\forall a \in \mathbb{Z}$, $a^p \equiv a \pmod{p}$.
7. **Wilson's Theorem.** If p is prime, then $(p-1)! \equiv -1 \pmod{p}$.
8. **Solvability of $x^2 \equiv -1 \pmod{p}$.** Let p be a prime. Then, $x^2 \equiv -1 \pmod{p}$ hasa solution $x \in \mathbb{Z}$ iff $p = 2$ or $p \equiv 1 \pmod{4}$.
9. **Fermat's Theorem on Sum of Squares.** Let p be a prime such that $p \equiv 1 \pmod{4}$. Then p can be written as $p = a^2 + b^2$ with $a, b \in \mathbb{Z}$.
10. **Solving Degree 1 Congruences.** Let $a, b \in \mathbb{Z}$ and let $g = \gcd(a,m)$. Then:
    (a) The congruence $ax \equiv b \pmod{m}$ has a solution iff $g \mid b$.
    (b) If (a) is true, then $\frac{a}{g}x \equiv \frac{b}{g} \pmod{\frac{m}{g}}$ has a solution modulo $\frac{m}{g}$.
11. **Chinese Remainder Theorem.** If $x \equiv a_1 \pmod{m_1}, \ldots, x \equiv a_k \pmod{m_k}$ (where the m_i's are pairwise relatively prime), then let $M = m_1 m_2 \cdots m_k$ and $y_i = \text{inverse}\left(\frac{M}{m_i} \pmod{m_i}\right)$. Then, a solution to the simultaneous congruence is given by $x \equiv a_1 \frac{M}{m_1} y_1 + \cdots + a_k \frac{M}{m_k} y_k \pmod{M}$.
12. **Theorem.** If $m \in \mathbb{Z}_{>0}$, then $\phi(m) = \left(\prod_{p \text{ prime}, p \mid m} (1 - \frac{1}{p})\right) \cdot m$.
13. **RSA Cryptography Lemma.** Suppose $m \in \mathbb{Z}_{>0}$ and $\gcd(a,m) = 1$. Let $h, h' \in \mathbb{Z}_{>0}$ such that $hh' \equiv 1 \pmod{\phi(m)}$. Then $a^{kk'} \equiv a \pmod{m}$.
14. **Primality Testing.** If there is an integer a such that $0 < a < m$ and $a^{m-1} \not\equiv 1 \pmod{m}$, then m is not prime.

15. **Hensel's Lemma.** To solve the congruence $f(x) \equiv 0 \pmod{p^k}$, first find the solutions to $f(x) \equiv 0 \pmod{p}$. Then, for each solution a_1 to $f(x) \equiv 0 \pmod{p}$, "lift" its solution by the recurrence relation $a_2 = a_1 - f(a_1)\overline{f'(a_1)}$, where $\overline{f'(a_1)}$ is found by solving $f'(a_1)\overline{f'(a_1)} \equiv 1 \pmod{p}$ for $\overline{f'(a_1)}$. To higher powers, we generalize this recurrence relation to $a_{j+1} = a_j - f(a_j)\overline{f'(a_1)}$.

---

16. **Hensel's Lemma (General Case).** Let $f \in \mathbb{Z}[x]$, $a \in \mathbb{Z}$, $j \in \mathbb{Z}_{>0}$, and $\tau \in \mathbb{N}$. Assume that $f(a) \equiv 0 \pmod{p^j}$, $p^\tau \mid\mid f'(a)$ and $j \geq 2\tau + 1$. Then:
    (a) There is a $\tau \in \mathbb{Z}$, unique modulo p, such that $f(a + tp^{j-\tau}) \equiv 0 \pmod{p^{j+1}}$.
    (b) If $b \equiv a \pmod{p^{j-\tau}}$, then $f(b) \equiv f(a) \pmod{p^j}$ and $p^j \mid\mid f'(b)$.
17. **Corollary to Hensel's Lemma.** Let $f \in \mathbb{Z}[x]$, p be prime, $a \in \mathbb{Z}$, $\tau \in \mathbb{N}$, and let $l \in \mathbb{Z}$. Assume that $p^\tau \mid\mid f'(a)$, $f(a) \equiv 0 \pmod{p^l}$, and $l \geq 2\tau + 1$. Then, for any $\alpha \geq l$, there exists a $b \in \mathbb{Z}$, unique modulo $p^{\alpha-\tau}$, such that $b \equiv a \pmod{p^{l-\tau}}$ and $f(b) \equiv 0 \pmod{p^\alpha}$.
18. **Lemma.** Let $f \in \mathbb{Z}[x]$ and p prime. Assume that $a_1, \ldots, a_r$ are roots of $f \pmod{p}$, with $r > 0$ and $a_i \equiv a_j \pmod{p}$ for all $i \neq j$. Then there is a polynomial $g \in \mathbb{Z}[x]$ such that $f(x) \equiv (x - a_1)g(x) \pmod{p}$. Also, for any such g, $a_1, \ldots, a_r$ are roots of g modulo p.
19. **Theorem.** If $f(x) \equiv 0 \pmod{p}$ has (at least) r solutions $x \equiv a_1, \ldots, a_r \pmod{p}$, with $a_i \not\equiv a_j \pmod{p}$ (for all $i \neq j$), then there is a polynomial $q \in \mathbb{Z}[x]$ such that $f(x) \equiv (x - a_1) \cdots (x - a_r)q(x) \pmod{p}$.
20. **Theorem 2.26.** The congruence $f(x) \equiv 0 \pmod{p}$ of degree $n \geq 0$ has at most n solutions.
21. **Corollary 2.27.** If $f \in \mathbb{Z}[x]$ has degree $n \geq 0$ (thus, $f \neq 0$), and the congruence $f(x) \equiv 0 \pmod{p}$ has more than n distinct solutions, then $f \equiv 0 \pmod{p}$ (as polynomials).
22. **Lemma.** Let $f \in \mathbb{Z}[x]$ be a monic polynomial of degree n. If the congruence $f(x) \equiv 0 \pmod{p}$ has n solutions, $x \equiv a_1, \ldots, a_n \pmod{p}$, distinct modulo p, then $f(x) \equiv (x - a_1) \cdots (x - a_n) \pmod{p}$.
23. **Proposition.** Let $f \in \mathbb{Z}[x]$. Then there is a well-defined function $\tilde{f}$ with $\tilde{f} : \mathbb{Z}/m\mathbb{Z} \to \mathbb{Z}/m\mathbb{Z}$ given by $\tilde{f}(\tilde{a}) = \widetilde{f(a)}$ for all $\tilde{a} \in \mathbb{Z}/m\mathbb{Z}$.
24. **Proposition.** Let $f, g \in \mathbb{Z}[x]$. If $f \equiv g \pmod{m}$ (as polynomials), then $\tilde{f} = \tilde{g}$ (as functions $\mathbb{Z}/m\mathbb{Z} \to \mathbb{Z}/m\mathbb{Z}$).
25. **Corollary.** Let $\psi : \mathbb{Z}/m\mathbb{Z} \to \mathbb{Z}/m\mathbb{Z}$ be any function. If ψ can be given by a polynomial (i.e. $\psi = f$ for some $f \in \mathbb{Z}[x]$), then it can be given by a polynomial of degree less than p.
26. **Theorem 2.28.** If $F : \mathbb{Z}/p\mathbb{Z} \to \mathbb{Z}/p\mathbb{Z}$, then there is a polynomial $f \in \mathbb{Z}[x]$ with degree at most $p - 1$ such that $F(x) \equiv f(x) \pmod{p}$ for all residue classes x modulo p.
27. **Theorem.** The polynomials in Theorem 2.28 are unique modulo p.
28. **Corollary 2.30.** Suppose $d > 0$ and $d \mid (p - 1)$, then the congruence $x^d \equiv 1 \pmod{p}$ has exactly d solutions.
29. **Proposition.** Let a have order h modulo m, and let $n \in \mathbb{N}$. Then, $a^n \equiv 1 \pmod{m}$ iff n is a multiple of h.
30. **Corollary.** If a has order h (modulo m), then $h \mid \phi(m)$.
31. **Corollary.** Let $m, m' \in \mathbb{Z}_{>0}$ and $a \in \mathbb{Z}$. Assume that a has orders h and h' modulo m and m', respectively (i.e. $\gcd(a, m) = \gcd(a, m') = 1$). Then, if $m \mid m'$, then $h \mid h'$.
32. **Proposition.** Suppose g is a primitive root modulo m. Then:
    (a) $1, g, \ldots, g^{\phi(m)-1}$ are distinct modulo m.
    (b) The above numbers are a reduced residue system modulo m.

(c) Let $a \in \mathbb{Z}$, with $\gcd(a,m) = 1$. Then there exists an $i \in \mathbb{Z}$ such that for all $j \in \mathbb{N}$, $g^j \equiv a \pmod{m}$ iff $j \equiv i \pmod{\phi(m)}$.

33. **Generalization of Corollary 2.30.** Assume that there is a primitive root modulo m and let d be a positive divisor of $\phi(m)$. Then, the congruence $x^d \equiv 1 \pmod{m}$ has exactly d solutions.

34. **Generalization of Theorem 2.37.** Assume that there is a primitive root modulo m and let $n \in \mathbb{Z}_{>0}$, and let $a \in \mathbb{Z}$ coprime to m. Then the congruence $x^n \equiv a \pmod{m}$ has $\gcd(n, \phi(m))$ solutions if $a^{\phi(m)/\gcd(n,\phi(m))} \equiv 1 \pmod{m}$ or has no solutions otherwise.

35. **Euler's Criterion.** Let p be an odd prime and let $a \in \mathbb{Z}$ with $p \nmid a$. Assume that there is a primitive root modulo p. Then, $x^2 \equiv a \pmod{p}$ has two solutions if $a^{\frac{p-1}{2}} \equiv 1 \pmod{p}$ or has no solutions otherwise.

36. **Lemma.** Suppose $a \in \mathbb{Z}$ has order h modulo m. Then:

    (a) If $d > 0$, and $d \mid h$, then a^d has order $\frac{h}{d}$ modulo m.

    (b) For all $k \in \mathbb{N}$, a^k has order $\frac{h}{\gcd h,k} \pmod{m}$.

37. **Corollary.** If there is a primitive root modulo m, then there are $\phi(\phi(m))$ of them (as residue classes modulo m).

38. **Lemma.** Suppose that $a, b \in \mathbb{Z}$ have order h and k, respectively modulo m, and that h and k are coprime. Then, ab has order hk modulo m.

39. If p is prime, then there exists a primitive root modulo p.

40. **Lemma.** Let $m, m' \in \mathbb{Z}_{>0}$ with $m \mid m'$. Let $a \in \mathbb{Z}$, with $\gcd(a, m') = 1$. Then:

    (a) $\gcd(a,m) = 1$.

    (b) If h, h' are the orders of a and m' modulo m, respectively, then $h \mid h'$.

41. **Theorem.** Let p be an odd prime and let $\alpha \in \mathbb{Z}_{>0}$. THen there exists a primitive root modulo p^α.

42. **Theorem 2.41** There exists a primitive root modulo m iff $m = 1, 2, 4, p^\alpha, 2p^\alpha$, where $\alpha \in \mathbb{Z}_{>0}$ and p an odd prime.

43. **Theorem 2.39** If p is a prime, then there exist $\phi(\phi(p^2)) = (p-1)\phi(p-1)$ many primitive roots modulo p^2.

44. **Diffie-Hellman Key Exchange.** This is a process used in order to initialize the secure line before message transfers occur. Suppose Alice and Bob are the participants. Then:

    (a) They (publicly) agree on a large prime p (600 digits...) and a primitive root g modulo p.

    (b) Alice thinks up a number a, $1 < a < p-1$, and sends $g^a \underline{\bmod} p$ to Bob.

    (c) Bob thinks up a number b, $1 < b < p-1$, and sends $g^b \underline{\bmod} p$ to Alice.

    (d) Alice computes $(g^b)^a \underline{\bmod} p$ and Bob computes $(g^a)^b \underline{\bmod} p$, which becomes their shared key.

45. **Solving Quadratic Congruences Modulo $p \neq 2$.** Let $ax^2 + bx + c \equiv 0 \pmod{p}$ be a quadratic congruence with $a \not\equiv 0 \pmod{p}$. First, multiply it by $\bar{a} \underline{\bmod} p$ to get $x^2 + \bar{a}bx + \bar{a}c \equiv 0 \pmod{p}$. Then, complete the square to get $(x + \bar{2}\bar{a}b)^2 + \bar{a}c - (\bar{2}\bar{a}b)^2$. Then, solve the resulting congruence.

46. **Theorem 3.1.** Let $a, b \in \mathbb{Z}$. Then:

    (a) $\left(\frac{a}{p}\right) \equiv a^{(p-1)/2} \pmod{p}$.

    (b) $\left(\frac{ab}{p}\right) = \left(\frac{a}{p}\right)\left(\frac{b}{p}\right)$.

    (c) If $a \equiv b \pmod{p}$, then $\left(\frac{a}{p}\right) = \left(\frac{b}{p}\right)$.

(d) If $p \nmid a$, then $\left(\frac{a^2}{p}\right) = 1$ and $\left(\frac{a^2 b}{p}\right) = \left(\frac{b}{p}\right)$.

(e) $\left(\frac{1}{p}\right) = 1$ and $\left(\frac{-1}{p}\right) = (-1)^{(p-1)/2}$.

47. **Theorem 3.2 (Lemma of Gauss).** Let $a \in \mathbb{Z}$ be relatively prime to p and let n be the number of elements of the set $\{j \in \{1,2,\ldots,p-1\} \mid ja\underline{\bmod}p > \frac{p}{2}\}$. Then, $\left(\frac{a}{p}\right) = (-1)^n$.

48. **Part of Theorem 3.3.** Let $a \in \mathbb{Z}$ be relatively prime to p. Assume also that a is odd. Let $t = \sum_{j=1}^{(p-1)/2}\left[\frac{ja}{p}\right]$. Then, $\left(\frac{a}{p}\right) = (-1)^t$.

49. **Quadratic Reciprocity.** We have:

(a) $\left(\frac{-1}{p}\right) = 1$ if $p \equiv 1 \pmod 4$ and -1 if $p \equiv -1 \pmod 4$.

(b) $\left(\frac{2}{p}\right) = 1$ if $p \equiv \pm 1 \pmod 8$ and -1 if $p \equiv \pm 3 \pmod 8$.

(c) For all odd primes p, q with $p \neq q$, we have that $\left(\frac{p}{q}\right)\left(\frac{q}{p}\right) = (-1)^{\frac{p-1}{2}\cdot\frac{q-1}{2}}$.

50. **Variation of Theorem 3.4.** If p, q are odd primes, then $\left(\frac{q}{p}\right) =$

(a) $\left(\frac{p}{q}\right)$ if $p \equiv 1 \pmod 4$ or $q \equiv 1 \pmod 4$.

(b) $-\left(\frac{p}{q}\right)$ if $p \equiv q \equiv -1 \pmod 4$.

51. **Quadratic Reciprocity for Jacobi Symbols** Let Q be an odd positive integer. Then:

(a) $\left(\frac{-1}{Q}\right) = (-1)^{\frac{Q-1}{2}}$.

(b) $\left(\frac{2}{Q}\right) = (-1)^{\frac{Q^2-1}{8}}$.

(c) If P is an odd positive integer, then $\left(\frac{P}{Q}\right) = (-1)^{\frac{P-1}{2}\cdot\frac{Q-1}{2}}\left(\frac{Q}{P}\right)$

52. **Lemma.** For all odd positive integers a and b, we have $\frac{ab-1}{2} \equiv \frac{a-1}{2} + \frac{b-1}{2} \pmod 2$, so therefore, $(-1)^{\frac{ab-1}{2}} = (-1)^{\frac{a-1}{2}}(-1)^{\frac{b-1}{2}}$.

53. For all odd positive integers a and b, we have $\frac{(ab)^2-1}{8} \equiv \frac{a^2-1}{8} + \frac{b^2-1}{8} \pmod 2$, so therefore, $(-1)^{\frac{(ab)^2-1}{8}} = (-1)^{\frac{a^2-1}{8}}(-1)^{\frac{b^2-1}{8}}$.

54. **Theorem 3.10.** Let $f(x,y) = ax^2 + bxy + cy^2$ be a nonzero binary quadratic form with integer coefficients, and let $d = b^2 - 4ac$ be its discriminant. Then:

(a) If d is a perfect square (including 0), then f can be factored into two linear factors with integer coefficients.

(b) If d is not a perfect square, then f cannot be factored into linear factors with rational coefficients.

55. **Theorem.** Let $d \in \mathbb{Z}$. Then there exists a binary quadratic form of discriminant d iff $d \equiv 0 \pmod 4$ or $d \equiv 1 \pmod 4$.

56. **Theorem 3.13.** Let $n, d \in \mathbb{Z}$ with $n \neq 0$. Then there exists a form of discriminant d that properly represents n iff the congruence $x^2 \equiv d \pmod{4|n|}$ has a solution.

57. **Corollary.** Let p be an odd prime and $d \in \mathbb{Z}$. Then there is a form of discriminant d that (properly) represents p iff $\left(\frac{d}{p}\right) = 0$ or 1.

58. **Corollary.** Let p be a prime. Then there exists a binary quadratic form of discriminant -4 that represents p iff p is represented by x^2+y^2.

59. **Theorem.** Let f be a positive definite quadratic form of discriminant -4. Then an integer n is represented by f iff it is represented by x^2+y^2.

60. **Theorem.** Let $d \in \mathbb{Z}$ and assume $d \equiv 0 \pmod 4$ or $d \equiv 1 \pmod 4$. Then there is a finite list $f_1, \ldots, f_n$ of forms of discriminant d such that for all $n \in \mathbb{Z}$, n is represented by some form of discriminant d iff f is represented by one of $f_1, \ldots, f_n$.

61. **Theorem.** For any $d \equiv 0 \pmod 4$ or $d \equiv 1 \pmod 4$, there are infinitely many forms of discriminant d.

62. **Theorem.** Let $a,b,c,d \in \mathbb{R}$ and $M = \begin{pmatrix} a & b \\ c & d \end{pmatrix}$. Then:

    (a) $T_M(\mathbb{Z}^2) \subseteq \mathbb{Z}^2$ (i.e. $T_M(x,y) \in \mathbb{Z}^2$ for all $(x,y) \in \mathbb{Z}^2$) iff $a,b,c,d \in \mathbb{Z}$.

    (b) T_M maps $\mathbb{Z}^2$ bijectively to $\mathbb{Z}^2$ iff $a,b,c,d \in \mathbb{Z}$ and $\det M = \pm 1$.

63. **Theorem.** Let $\sim$ be the relation that determines whether two binary quadratic forms are equivalent. Then, $\sim$ is an equivalence relation.

64. **Theorem.** Let f,g be equivalent forms. Then:

    (a) f and g represent the same numbers.

    (b) f and g properly represent the same numbers.

65. **Reducing Quadratic forms** Begin with $f(x,y) = ax^2+bxy+cy^2$. Carry out the following procedure:

    (a) *Step 1:* If $|c| < |a|$, then $\begin{pmatrix} 0 & 1 \\ -1 & 0 \end{pmatrix} \in \Gamma$ takes f to $f(y,-x) = cx^2-bxy+ay^2$. So, after doing this if necessary, we may assume that $|a| \leq |c|$.

    (b) *Step 2:* Notice that, for any $m \in \mathbb{Z}$, the matrix $\begin{pmatrix} 1 & m \\ 0 & 1 \end{pmatrix} \in \Gamma$ takes $f(x,y)$ to $f(x+my,y) = ax^2 + (2am+b)xy + (am^2+bm+c)y^2$. Choose m (unique) such that $-|a| < 2am+b \leq |a|$.

    (c) *Step 3:* If $|c| < |a|$, go back to Step 1. Otherwise, continue.

    (d) *Step 4:*
        - If $|c| > |a|$, done; we have a reduced form.
        - If $|c| = |a|$ and $b \geq 0$, done; we have a reduced form.
        - If $|c| = |a|$ and $b < 0$, then use $\begin{pmatrix} 0 & 1 \\ -1 & 0 \end{pmatrix}$ again. Your form is reduced, because $0 < b < |a| = |c|$.

---

66. **Theorem.** Let $d \in \mathbb{Z}$ be not a perfect square. Then:

    (a) If f is indefinite ($d > 0$), then $0 \leq |a| \leq \frac{\sqrt{d}}{2}$.

    (b) If f is positive definite ($d < 0$, $a > 0$, and $c > 0$), then $0 < a < \sqrt{-\frac{d}{3}}$.

    (c) Excluding negative forms (with $d < 0$), there are only finitely many reduced forms of discriminant d.

67. **Corollary.** Let $d \in \mathbb{Z}$, not a perfect square. Then there are only finitely many equivalence classes of forms of discriminant d.

68. **Lemma.** Let $f(x,y) = ax^2+bxy+cy^2$ be a reduced positive definite form. Then:

(a) Suppose that $x, y \in \mathbb{Z}$ are coprime and that $f(x,y) \leq c$. Then, $f(x,y)$ is equal to a or c and (x,y) is one of $\pm(1,0), \pm(0,1), \pm(1,1)$.

(b) The number of proper representations of a by f is:

i. 2 if $a < c$.

ii. 4 if $0 \leq b < a = c$.

iii. 6 if $a = b = c$.

69. **Theorem 3.25.** Let f and g be reduced positive definite forms. If f is equivalent to g, then $f = g$.

70. **Theorem.** Let $f(x,y) = ax^2 + bxy + cy^2$ be a reduced positive definite form. Then $w(f) =$

    (a) 4 if $a = c$ and $b = 0$.

    (b) 6 if $a = b = c$.

    (c) 2 if otherwise.

71. **Lemma.** Let f be a positive definite form, let g be a form equivalent to f and let $M \in \Gamma$ be a matrix that takes f to g, so $g = f \circ T_M$. Then:

    (a) If $A_1, \ldots, A_r$ are distinct automorphs of f, then $A_1M, \ldots, A_rM$ are distinct elements of Γ that take f to g.

    (b) Conversely, if $B_1, \ldots, B_r$ are distinct elements of Γ that take f to g, then $B_1M^{-1}, \ldots, B_rM^{-1}$ are distinct automorphs of f.

72. **Theorem.** Let f be a positive definite form. Then, $w(f) \in \{2,4,6\}$ and it depends only on the equivalence class of f.

73. **de Polignac's Formula.** Let $n \in \mathbb{N}$, let p be prime, and let $e = \sum_{i=1}^{\infty} \left[\frac{n}{p^i}\right]$. Then, $p^e \mid\mid n!$.

74. **Theorem.** Let f be a multiplicative function and let $F(n) = \sum_{d|n}$. Then F is also multiplicative.

75. **Corollary.** $\sum_{d|n} \phi(d) = n$.

76. **Corollary.** For all $n \in \mathbb{Z}_{>0}$, if $n = \prod p^{\alpha(p)}$, then:

$$\sigma(n) = \prod_{p|n} \frac{p^{\alpha(n)+1} - 1}{p - 1}.$$

77. **Theorem.**

    (a) The Möbius function μ is multiplicative.

    (b) $\sum_{d|n} \mu(d) = 1$ if $n = 1$ and $= 0$ if otherwise.

78. **Möbius Inversion Formula.** If $F(n) = \sum_{d|n} f(d)$ for all $n > 0$, then $f(n) = \sum_{d|n} \mu(d)F(n/d)$ for all $n > 0$.

79. **Converse of Möbius Inversion Formula.** If $f(n) = \sum_{d|n} \mu(d)F(n/d)$ for all $n > 0$, then $F(n) = \sum_{d|n} f(d)$ for all $n > 0$.

80. **Properties of Simple Continued Fractions.** Let $\langle x_0, \ldots, x_n \rangle$ be a finite continued fraction. Then:

    (a) $\langle x_0, \ldots, x_n \rangle = x_0 + \frac{1}{\langle x_1, \ldots, x_n \rangle}$ if $n > 0$.

    (b) $\langle x_0, \ldots, x_n \rangle = \langle x_0, \ldots, x_{n-2}, x_{n-1} + \frac{1}{x_n} \rangle$ if $n > 0$.

    (c) $\langle x_0, \ldots, x_n \rangle \geq x_0$, with equality iff $n = 0$.

81. **Theorem.** Every finite simple continued fractions evaluates to a rational number.

82. **Theorem (Existence of Simple Continued Fractions).** For all $x \in \mathbb{Q}$, there is a finite sequence $a_0, \ldots, a_n \in \mathbb{Z}$ with $n \in \mathbb{N}$ such that $a_i > 0$ for all $i > 0$ and $x = \langle a_0, \ldots, a_n \rangle$.

83. **Theorem.** Let $\langle a_0, \ldots, a_n \rangle$ and $\langle b_0, \ldots, b_m \rangle$ be finite simple continued fractions. Assume the following:

    (a) $n = 0$ or $a_n > 1$.

    (b) $m = 0$ or $b_m > 1$.

    (c) $\langle a_0, \ldots, a_n \rangle = \langle b_0, \ldots, b_m \rangle$.

    Then, $n = m$ and $a_i = b_i$ for all i.

84. **Theorem.** Let $a_0, a_1, \ldots$ be an infinite sequence of integers, with $a_i > 0$ for all $i > 0$. Define sequences $\{h_n\}$ and $\{k_n\}$ (with $n = -2, -1, 0, 1, \ldots$) defined by $h_{-2} = 0$, $h_{-1} = 1$, $h_n = a_n h_{n-1} + h_{n-2}$ for all $n \geq 0$ and $k_{-2} = 1$, $k_{-1} = 0$, $k_n = a_n k_{n-1} + k_{n-2}$. Then, for any sequence $\{a_n\}$ as defined, we have:

    $$\langle a_0, \ldots, a_{n-1}, x \rangle = \frac{h_{n-1}x + h_{n-2}}{k_{n-1}x + k_{n-2}}$$

    for all $n \geq 0$ and $x \in \mathbb{R}_{>0}$.

85. **Proposition.** Let $n \in \mathbb{N}$ and let $r_n = \langle a_0, \ldots, a_n \rangle$. Then $r_n = h_n / k_n$.

86. **Lemma.** We have the following:

    (a) $h_n k_{n-1} - h_{n-1} k_n = (-1)^{n-1}$ for all $n \geq -1$.

    (b) $r_n - r_{n-1} = \frac{(-1)^{n-1}}{k_n k_{n-1}}$ for all $n \geq -1$.

87. **Corollary.** $\gcd(h_n, k_n) = 1$ for all $n \geq 0$.
